

Mansa Musa Integrated Solutions Whitepaper

Together we rise

May 2026

Important Notice

This whitepaper is provided by Ubuntu Tribe for informational purposes only and does not constitute investment advice, a solicitation, or an offer to buy or sell any securities, tokens, or financial instruments. Nothing in this document should be interpreted as a recommendation to engage in any transaction. Statements regarding future products, roadmaps, partnerships, regulatory engagements, and financial projections are forward looking. Actual outcomes may differ materially due to market conditions, regulatory developments, technology, and execution risk.

Ubuntu Tribe products are available only in jurisdictions where they are lawfully permitted. Users are responsible for compliance with their local laws, including tax, securities, and anti-money-laundering obligations.

This document is confidential. It may not be reproduced or distributed without prior written consent.

Contact & Corporate Information

Ubuntu Tribe operates through a network of regulated entities across Africa, Europe, and the Americas. Corporate entities are listed below. For all regulatory enquiries, please refer to the official contact channels provided in Appendix C.

Corporate entities

Entity	Description
Ophir Ubuntu International LLC	Mauritius — registered holding company
Ubuntu Uhuru s.r.o.	Czech Republic — registered VASP
The Ubuntu Investment Company	United States — institutional arm
Imperial Gold Holdings	United Kingdom — UK holdings
Mansa Musa Integrated Solutions Nigeria Ltd	Nigeria — local entity established for regulatory engagement and market entry (not yet operational)

Regulatory posture

	Jurisdictions
Active licences	Czech Republic · South Africa · Mauritius, regulatory sandbox in Kenya.
Active engagements	Ghana · India · UAE · Botswana · Singapore

Executive Summary

Ubuntu Tribe is building the regulated, accessible, gold-backed financial infrastructure for global users. This whitepaper details the core technology, products, and governance that make it work.

The Offering

\$GIFT is a tokenized gold instrument where 1 \$GIFT = 1 milligram of investment grade gold 995.0 fine gold, held in secure vaults in Copenhagen, Stuttgart, Zurich, the UAE, and Singapore. The gold backing GIFT is physically counted by accredited third parties (mentioned below) and reconciled to the number of token issues, providing audited proof of reserves. Minimum purchase: USD \$0.15.

The Stack

\$GIFT is deployed on the Polygon blockchain, and the smart contracts are independently audited for security multiple times per year. User wallet assets are self-consumed via Web3Auth MPC Core Kit (2 of 4) or external wallets, including MetaMask integration. Institutional gold reserves and the issuance layer are secured via Fireblocks MPC with multi signature controls. KYC/AML follows a three-tier model (Tier 1 regulatory data collection only — no transactions permitted, Tier 2 up to USD \$50K, Tier 3 USD \$500K+) with FATF Travel Rule compliance at USD \$100 thresholds and 7-year HMAC chained audit retention.

The Products

The Utribe Wallet and \$GIFT Portal give retail and institutional users direct access to buy, hold, send, and redeem \$GIFT across 16 fiat currencies via PCI compliant payment service providers and on chain crypto rails.

The Supply

Ubuntu Tribe sources gold from ethically operated African mines with end-to-end traceability from extraction to vault to token.

The People

Ubuntu Academy makes financial literacy and the responsible use of digital gold accessible to communities across Africa and beyond — turning users into informed participants.

The Governance

Corporate structure spans Ophir Ubuntu International LLC (Mauritius), Ubuntu Uhuru s.r.o. (Czech VASP), Ubuntu Tribe Limited (Kenya), Ubuntu Tribe Pty Ltd (South Africa), Ubuntu Tribe Pte Ltd (Singapore), Ubuntu Tribe Ghana Ltd (Ghana), Ubuntu Investment Company (US) and Imperial Gold Holdings (UK).

This document follows the architecture, mechanics, compliance posture, and operating commitments of Ubuntu Tribe in detail.

PART I — TECHNOLOGY

01 Technology Stack

Ubuntu Tribe is engineered as a modular platform. Each layer is selected for production of reliability, security posture, and the ability to scale across consumer and institutional workloads. The stack is intentionally consolidated: the same components serve the wallet, the portal, Tokenization as a Service (TaaS), and the supply chain tracker, which accelerates time to launch for every new product.

Layer	Technology
Frontend	Vue 3, Tanstack, PrimeVue, Tailwind v4
Wallet / Auth	Web3Auth MPC CoreKit (2 of 4), external self custodial wallets (MetaMask, hardware wallets) via WalletConnect / Reown
Blockchain	Polygon, Ongoing upgrade to Layer 1
Backend	Node.js, Express
Database	Couchbase, PostgreSQL
Identity	Keycloak — JWT, SSO
Streaming	Apache Kafka
AI	ElevenLabs, Claude, OpenAI
Analytics	Elliptic
Oracle	Chainlink + internal Proof of Reserve

Custody	Fireblocks MPC
Vaults	Sequoyah Vaults — regulated precious metals custodian; audited and insured

A shared infrastructure layer compresses the launch cycle for every new product on top of it.

02 Smart Contracts & Proof of Reserve

\$GIFT is issued as an ERC-20 token on the Polygon blockchain, implemented as UUPS upgradeable proxies. Upgradeability is governed by a multi signature controller with mandatory time locks; the contracts are pausable as a circuit breaker for incident response. The contract logic enforces a strict pre-mint verification chain — no token is created without dual oracle confirmation.

Independent Smart Contract Audits

The Ubuntu Tribe smart contract suite consists of: GIFT Token, Proof of Reserve, Mint Controller, Compliance Registry, Time-lock Controller, and Chainlink Oracle. Full contract addresses and external audit reports are disclosed in the formal offering documentation and available upon request.

The platform's automated test suite maintains hundreds of quality assurance tests and releases are only permitted when zero Critical and zero High findings are identified. No token can be issued without dual oracle confirmation of sufficient reserves.

Reserve Attestation

Reserve attestations are published on chain anchoring via Chainlink Proof of Reserve. Independent reserve audits by Harris and Trotter (HT Digital) are conducted quarterly and made available to regulators upon request.

Dual Proof of Reserve

Every mint operation is gated by two independent reserve oracles: Chainlink's industry standard Proof of Reserve feed, and Ubuntu Tribe's internal redundant Proof of Reserve contract sourced from vault attestations. Both must confirm a sufficient unallocated balance before minting can proceed. This protects against single oracle compromise and against silent over issuance.

Allocation model

Reserves are allocated, not pooled — each milligram of gold backing \$GIFT is segregated and assigned, with cross vault distribution across at least three independent custodians. All physical reserves are fully insured. The contract launches with 40–50% over collateralization as a buffer and operates with a 30% steady state minimum floor. Reserve drawdown below this floor requires an 80% supermajority of governance and a transparent on chain proposal.

Five Step Reserve Proof Process

1. **Physical custody** — Investment grade metal is held with regulated custodians at audited vault locations.
2. **Reserve ledger update** — Each physical movement is recorded as a tamper evident update to the onchain reserve ledger.
3. **Independent auditor co-sign** — Every reserve update is co-signed by a licensed independent auditor before it is treated as final.
4. **Automatic reserve gate** — Before any new token is created, the platform automatically compares the requested issuance against the verified reserve. If issuance would breach the minimum floor, the platform refuses the mint.
5. **Public reserve view** — Anyone can query the reserve record directly and see the full backing position per metal in real time — no waiting for a periodic report.

Redemption flow

A redemption request triggers a PoR verification, an on-chain burn of the user's \$GIFT, and disbursement either as physical bullion delivery (for qualifying tickets) or fiat equivalent through one of the integrated payment rails described in Chapter 03.

03 Payments & Custody

Ubuntu Tribe partners with five PCI compliant payment providers with intelligent routing — the optimal rail for each transaction is selected based on user location, currency, ticket size, and rail availability. Sixteen currencies are supported at point of sale: USD, EUR, CHF, GBP, AED, AUD, CAD, KES, NGN, GHS, ZAR, UGX, TZS, XAF, XOF, and INR.

Rail	Coverage
Flutterwave	NGN, USD, GHS, KES, ZAR
Blusalt	NGN
JuicyWay	NGN, USD
Uphold	USD, EUR, GBP + crypto
SEPA bank transfer	EUR
Crypto swap	USDC, USDT, POL

Payment flow

Every inbound transaction pass through a deterministic pipeline: HMAC validated webhook → idempotency check → KYC tier verification → sanctions screening against OFAC, EU, UN, and HM Treasury lists → risk score evaluation → mint instruction → append only audit log. Internal flows include the Gas Advance facility (which prefunds POL for first time users, so they never need to acquire native gas), and referral payouts processed against the community's impact allocation.

Vault Operations

Physical gold reserves are held in segregated, allocated storage at institutional grade vaults in Copenhagen, Stuttgart, Zurich, the UAE, and Singapore. Vault operators are professional precious metals custodians selected from a panel of internationally accredited firms (mentioned below). All vault holdings are subject to full physical insurance coverage by specialist precious metals insurers. Physical metal is currently held at Sequoyah Vaults, the operational vault custody partner for the Ubuntu Tribe.

Digital Custody Architecture

Wallet self-custody (Utribe Wallet - consumer / \$GIFT holders). Users of the Utribe Wallet retain full selfcustody of their digital assets at all times.

The wallet is built on Web3Auth MPC Core Kit (a 2 of 4 threshold signing scheme: user device, social login share, recovery share, and Ubuntu Tribe cosigner share for assisted recovery only) and supports interoperability with external self-custodial wallets (MetaMask, WalletConnect / Reown, hardware wallets). At no point does Ubuntu Tribe hold unilateral control over user assets in the wallet; the cosigner's share alone cannot move funds.

Vault custody (institutional gold reserves). The physical gold backing \$GIFT tokens is held in segregated, allocated vaults operated by Sequoyah Vaults, our regulated vault custody partner. The minting authority key, the operational treasury, and the institutional issuance wallet are secured via Fireblocks MPC infrastructure with hardware security modules, multi signature withdrawal controls, role-based policy engines, and SOC 2 Type II certification. This Fireblocks secured layer governs the issuance and redemption side of \$GIFT — not user wallets.

Separation is enforced contractually and operationally. Customer held \$GIFT in the Utribe Wallet remains the property of the holder and is recorded on chain in the user's self-custodial address. Customer allocated physical gold is held by the Sequoyah bailment custodian on behalf of identified token holders and is ring fenced from Ubuntu Tribe operational treasury; it does not form part of the operator's insolvency estate (see Bankruptcy Remoteness below).

Bankruptcy Remoteness

The physical metal backing for each token is held by a separate legal vehicle whose sole purpose is to hold metal for the benefit of token holders. In the event of operator insolvency, the vehicle's assets are not part of the insolvency estate; holders redemption rights survive operator failure.

04 Security

Security is enforced in depth across seven independent layers. Each layer is independently audited, monitored, and capable of failing safely without compromising the others.

Layer	Controls
Physical vault	Biometric access, armed guards, seismic monitoring; two auditor reserve attestation (Crowe physical + HT Digital proof of reserves)
Custody	Wallet self-custody (Web3Auth MPC 2 of 4 or external wallet) for user assets; Fireblocks MPC with multi signature thresholds for institutional gold issuance
Smart contract	UUPS proxy, pausable, mandatory dual PoR before mint
Oracle	Chainlink + internal redundancy — both required
Wallet	Web3Auth MPC 2 of 4, biometric
Layer	Controls
Network	DDoS protection, IDS, Quantum-Enhanced ciphers, rate limits
Application	Strict CSP, CSRF protection, input sanitization, OWASP compliant penetration testing, bug bounty
Secrets	Environment injected only — no in code secrets, no committed keys

Service level objectives for remediation: Critical findings 24 hours, High 7 days, Medium 30 days. The platform undergoes independent annual security audits and operates a continuous bug bounty program.

Penetration Testing & Security Audit

In April 2026, the platform underwent an independent third-party security audit and penetration test conducted by ITnetworX GmbH (Switzerland), receiving scores of 94/100 (security audit) and 96/100 (penetration test) with zero exploitable findings. The engagement also produced an ISO/IEC 27001:2022 external audit attestation confirming Annex A controls are in place. Full reports are available to regulators upon request.

Incident Response

A documented Incident Response Plan covers security, custody, and operational events, with named on call responders and defined escalation paths to executive and regulatory disclosure where required.

Business Continuity and Disaster Recovery

Business Continuity and Disaster Recovery procedures are maintained covering core systems, vault access, and customer service. Plans are tested annually and available to regulators upon request

05 Compliance & KYC/AML

Compliance Governance

Compliance is overseen by a designated Money Laundering Reporting Officer (MLRO) under the regulatory frameworks of each licensed jurisdiction. The MLRO is responsible for AML/CFT policy, suspicious transaction reporting, and regulatory liaison.

FATF Travel Rule Implementation

FATF Recommendation 16 (Travel Rule) is implemented for all transfers at or above the USD \$100 equivalent threshold, with originator and beneficiary information collected at the point of onboarding or conducting a transaction, plus KYC information collected at onboarding, and exchanged with counterparties via compliant interoperability protocols.

Sanctions and PEP Screening

All customers and transactions are screened against OFAC, UN, EU, and HM Treasury consolidated sanctions list in real time. Politically Exposed Persons (PEPs) and adverse media screening are performed at onboarding and on an ongoing basis. Identity verification, document checks, facial recognition, PEP screening, sanctions screening, and address verification are delivered through Sumsub. Real time on chain transaction monitoring and blockchain analytics are delivered through Elliptic. Both providers operate in production across all licensed jurisdictions.

Record Retention

Transaction records: On-chain transactions involving \$GIFT are recorded immutably on the underlying public blockchain and therefore persist indefinitely. Off-chain records held by Ubuntu Tribe: KYC files, internal compliance records, transaction monitoring logs, and FATF Travel Rule originator/beneficiary information are retained for a minimum of seven years from the customer relationship end date, with HMAC chained tamper evident audit trails, in line with FATF and applicable EU AML directives.

Customer Asset Segregation

Customer fiat balances are held in segregated client money accounts at regulated banking partners; digital assets are held in segregated customer wallets distinct from operational treasury.

Ubuntu Tribe operates under a tiered KYC framework, calibrated to risk and ticket size. Compliance is enforced at the protocol level — not just at the front door — ensuring jurisdiction aware controls apply to every token transfer.

Tier	Who It Applies To	Transaction limit
Tier 0 — None	Unverified visitors	Read only access to public reserve data only
Tier 1 — Basic	Email and phone verification plus regulatory data collection: full name, date of birth, nationality, source of funds, occupation, physical address	No transactions — view only until upgrade to Tier 2
Tier 2 — Standard	Verified individual investors — Government ID + selfie biometric	Up to USD \$50,000
Tier 3 — Enhanced	Source of funds + PEP / adverse media screening	USD \$500,000+

Regulatory Mapping

Framework	Classification
MiCA (European Union)	VASP license issued July 2024. \$GIFT is architected as AssetReferenced Token (ART); upgrade to MiCA Asset-Referenced Token application in progress under the EU Markets in CryptoAssets Regulation.
Framework	Classification
DIFC / DFSA (Dubai)	Commodity backed tokens as Investment Tokens
VARA (Dubai mainland)	Asset-Referenced Virtual Asset framework

Compliance is continuous, not point in time. All accounts are subject to ongoing screening against OFAC, EU, UN, and HM Treasury sanctions list. On chain and off chain transactions are monitored using Elliptic. Travel Rule data is collected and filed from USD for \$100 thresholds. Suspicious Activity Reports are filed within 24 hours after the suspicion has been established, and no later than three business days from the initial trigger. The full audit trail is maintained for seven years in an encrypted, append only HMAC chained log.

\$GIFT is engineered to satisfy the MiCA Asset-Referenced Token (ART) framework. Ubuntu Tribe holds an active Czech Republic VASP registration providing passportable rights across the European Economic Area.

PART II — PRODUCTS

Market status. Ubuntu Tribe operates as an active digital asset platform with issued tokens, live infrastructure, and market presence across multiple jurisdictions. \$GIFT is issued, in circulation, and listed on BitMart and Coinstore. The platform serves over thirty thousand registered customers of ninety nationalities, with monthly trading volume more than one hundred million United States dollars. Market expansion into new jurisdictions is compliance driven, structured around the licensing and regulatory frameworks of each market.

06 \$GIFT — Tokenized Gold

\$GIFT is Ubuntu Tribe's flagship asset backed digital token. Each unit corresponds to a defined quantity of investment grade physical gold held in audited and insured custody. Token issuance is strictly linked to physical reserves through proof of reserve mechanisms. \$GIFT provides direct exposure to the underlying gold asset and does not represent equity, debt, profit sharing rights, governance rights, or any yield- or interest-bearing claim against Ubuntu Tribe or any other entity. \$GIFT is one milligram of investment grade 995.0 fine gold, held in allocated vault custody, mintable and redeemable on demand, divisible to the milligram, transferable in seconds, and verifiable on chain at any moment.

Pricing is referenced to the LBMA gold fix via a backend redundancy layer. Custody is distributed across five vault locations to mitigate jurisdictional and operational risk. Harris and Trotter (HT Digital) publish quarterly attestations cross referenced to the dual on chain Proof of Reserve described above.

Property	Specification
Name	Gold International Fungible Token
Ticker	\$GIFT
Backing	1:1 — 1 \$GIFT = 1 mg investment grade 995.0 gold
Standard	ERC-20, UUPS upgradeable
Blockchain	Polygon
Supply	Dynamic — minted on purchase, burned on redemption
Minimum purchase	USD \$0.15/ 1 \$GIFT
Vault locations	Copenhagen · Stuttgart · Zurich · UAE · Singapore
Reserve Auditors	reserve attestation (Crowe physical + HT Digital proof-of-reserves)

Oracle	Chainlink PoR + internal redundancy
--------	-------------------------------------

Property	Specification
Custody	Fireblocks MPC
Redemption	Physical bullion or fiat equivalent
Pricing reference	XAU/USD (Chainlink + CoinGecko backend)
Live exchanges	BitMart, Coinstore

Ubuntu Tribe does not presume the classification of \$GIFT under Nigerian law and will adopt the classification and regulatory treatment as determined by the Securities and Exchange Commission Nigeria.

\$SIFT — Silver International Fungible Token (Planned)

\$SIFT is a planned asset backed digital token representing physical silver, structurally identical to \$GIFT. It forms part of Ubuntu Tribe’s product roadmap and will be issued subject to regulatory approval and market readiness in each operating jurisdiction. \$SIFT has not been issued and is not in circulation. Ubuntu Tribe’s product roadmap also includes additional asset backed tokens covering other precious metals and commodities, and the potential issuance of a basket token providing diversified exposure to a curated set of underlying commodities. All such products are subject to applicable regulatory approval prior to launch and are presented as part of the development pipeline, not as current offerings.

07 Tokenomics & Fees

Ubuntu Tribe operates a two-component fee structure. A gold issuance premium of up to 5% applies at the point of token minting, representing the spread between the international gold spot price and the tokenized instrument price. A transaction fee in the range of 0.3% to 1.618% (the Golden Ratio) is applied to secondary transfers, swaps, conversions, and qualifying on platform transactions. Volume discounts apply to larger transactions. All fees are disclosed to the user before each transaction is confirmed. The fee allocation funds operations, grows reserves, and capitalizes community impact.

Fee allocation

- Operational expenses — infrastructure, custody, audit, compliance.
- Gold reserve growth — directly increasing the unallocated reserve buffer.
- Ecosystem development — product engineering, partner integrations, market activation.
- Community impact — 10% of every transaction fee, ring fenced for education, mining community reinvestment, and financial inclusion program

Internal gas fee rebalancing is handled by the protocol — users never need to manage POL or other native gas balances. The Gas Advance facility (Chapter 03) fronts gas for first time wallets and recovers transparently in token.

Revenue streams

Stream	Description
Mineral spread	Margin between wholesale and retail mineral price
Stream	Description
Transaction fee	1.618% on platform transactions
Swap fees	Cross asset swaps within the ecosystem
White label SaaS	Tiered subscription for institutional tenants
White label partner share	Revenue share on volume processed through partner portals
Yield float	Spread on managed reserve float
API access fees	Metered access for enterprise integrations

08 Utribe Wallet

Utribe Wallet is the user's primary gateway to the Ubuntu Tribe ecosystem. It is a non-custodial mobile application for iOS and Android, built on Web3Auth's MPC CoreKit. Private keys are split into four shares — device key, social login, passkey or biometric, and recovery backup — with a 2 of 4 reconstruction threshold. The user never holds a seed phrase and cannot lose their wallet through a single point of failure.

The wallet displays over 50 fiat currencies and 10 cryptocurrencies, with all values rendered in the user's local currency. A live gold price ticker offers 1H, 1D, 1W, 1M, 1Y, and All views. Send, receive, and swap functions are zero fee on internal transfers between Ubuntu Tribe wallets. External transfers incur the standard 1.618% fee.

Utribe Shield is the wallet security layer — biometric authentication, two factor authentication for sensitive actions, and explicit transaction confirmation. Gas Advance ensures first time wallets have zero onboarding friction.

Feature	Description
Custody model	Non-custodial, MPC 2 of 4, no seed phrases
Authentication	Biometric, passkey, social login
Assets	\$GIFT; 50+ fiat / 10+ crypto display
Price ticker	Live gold price — 1H / 1D / 1W / 1M / 1Y / All

Send / receive / swap	Internal transfers zero fee
Shield	Biometric + 2FA + transaction confirmation
Gas Advance	Zero friction first transaction

09 GIFT Portal

\$GIFT Portal at gift.tribe.app is the web platform companion to the mobile wallet. It serves three integrated layers that combine to support both individual buyers and institutional white label tenants.

Layer	Function
Mineral Wallet	Buy, hold, swap, redeem \$GIFT
\$GIFT Economy	Send vouchers, manage referrals, drive viral growth
White Label	Branded portals for institutional partners

Onboarding follows the tiered KYC framework described in Chapter 05, with the Tier 1 flow optimized for sub-five-minute completion. The buy flow accepts all 16 supported currencies and routes intelligently across the six payment rails described in Chapter 03.

The portal is fully multi-tenant, supporting distinct branding, feature flag configuration, and compliance postures for each tenant while sharing the underlying infrastructure.

PART III — ECOSYSTEM PROGRAMS

10 Ubuntu Academy

Ubuntu Academy is Ubuntu Tribe’s flagship education product — a two-sided African EdTech marketplace built on the same Ubuntu philosophy that underpins the financial stack. The tagline is “I am because we learn together.”

Ubuntu Tribe’s operating principle is “We Teach Before We Tokenize.” Where required by local regulation or operating policy, completion of foundational financial literacy content through Ubuntu Academy is a mandatory onboarding step before retail users access any Ubuntu Tribe product. This is a consumer protection architecture, not a marketing mechanism: it operationalizes informed participation and directly supports investor protection mandates. Ubuntu Academy is non-custodial and non-transactional; it generates no transaction revenue from users.

The African opportunity

Africa is home to roughly 600 million young people aged 18–35. The continental EdTech total addressable market is projected to reach USD \$8.5 billion by 2030. Every year approximately 12 million young people enter the labor market while fewer than 3 million formal jobs are created. 250 million children are out of school, and 153 million adults are functionally illiterate.

Brand pillars

Pillar	Commitment
Inclusivity	Access regardless of geography, income, or formal qualification
Relevance	Curriculum aligned to African labor markets and cultural context
Personalization	AI-driven learning pathways tailored to each learner’s profile across three dimensions of intelligence — cognitive (IQ), emotional (EQ), and spiritual (SQ).
Credibility	Accredited certifications with regional and continental recognition (details below)
Community	Peer learning, mentorship, cohort cohesion
Sustainability	Revenue share model that rewards tutors and reinvests in content

Two-sided marketplace

Tutors monetarize expertise; learners access affordable, relevant education. The platform handles discovery, payment, delivery, assessment, and credentialing. Revenue is shared transparently and paid in the user’s preferred currency.

Revenue stream	Split
Course sales	Tutor 70% / Platform 30%
Subscriptions	Recurring access to libraries and cohorts
Assessments	Per test fee, including holistic assessment
Corporate B2B	Bulk seats and tailored learning paths
Government partnerships	Scoped contracts with public agencies

Platform architecture (LMS)

The learning management system is composed of eight integrated modules: Discovery and Search, Identity and Family (including parent controlled family wallets), Holistic Assessment covering IQ, EQ, and SQ, an AI Pathway Engine for personalized learning, Content Delivery with offline capable mode for low bandwidth environments, an Assessment Engine, a Communication Hub for cohort and mentor interaction, and a Credentialing module producing portable, verifiable certificates.

Payment infrastructure

Payments support mobile money (M-Pesa, MTN MoMo, Airtel Money), card networks (Visa, Mastercard, Paystack, Flutterwave), installment plans for higher ticket courses, and parent-controlled family wallets.

Accreditation and rollout

South Africa anchors the accreditation strategy through alignment with GFETQSF, HEQSF, and OQSF frameworks, and partnership with the 21 SETAs. The pan African strategy progresses through Nigeria (NUC), Kenya (KNQA), and the continental ACQF framework.

Phase	Geography	Timeline	Targets
Phase 1	South Africa	Months 1–6	10,000 learners / 500 tutors
Phase 2	Nigeria · Kenya · Ghana	Months 6–18	100,000 learners / 2,000 tutors
Phase 3	Senegal + 10 markets	Months 18–36	500,000+ learners

PART IV — GOVERNANCE & FUTURE

11 Regulatory Framework

Ubuntu Tribe operates as a regulated VASP across multiple jurisdictions, with active licences and a deliberate engagement pipeline rather than opportunistic compliance arbitrage. The legal structure is anchored by Ophir

Ubuntu International LLC (Mauritius) at the group level, with Ubuntu Uhuru s.r.o. (Czech Republic) providing the EU VASP footprint and the route to MiCA passporting across the European Economic Area once Ubuntu Tribe's MiCA notification and Asset-Referenced Token classification are confirmed by the competent supervisory authority.

Active licenses and operating jurisdictions

Jurisdiction	Status
Czech Republic	VASP registration (Ubuntu Uhuru s.r.o.) — active
South Africa	Licensed — operational
Kenya	Sandbox — testing (Kenya)
Mauritius	Group seat (Ophir Ubuntu International LLC)

Active engagements

Jurisdiction	Posture
Ghana	Regulator engagement in progress
India	Engagement in progress
UAE	Engagement in progress
Botswana	Engagement in progress
Singapore	Engagement in progress

Nigeria — Regulatory Status

Ubuntu Tribe is currently engaging with the Securities and Exchange Commission of Nigeria under the Accelerated Regulatory Incubation Programme (ARIP) framework.

This engagement represents a pre-operational stage intended to align the company's product structure, operational model, and compliance framework with Nigerian regulatory expectations prior to market entry.

Mansa Musa Integrated Solutions Nigeria Ltd has been established as the local entity to support regulatory engagement and future operations. The entity is not yet operational.

Ubuntu Tribe will pursue the appropriate licensing and regulatory approvals as determined by the Commission before commencing any Nigerian market activities.

Nigeria — Engagement Approach.

Ubuntu Tribe is progressing its market entry through a structured regulatory engagement process under the Securities and Exchange Commission of Nigeria Rules on Issuance, Offering Platforms and Custody of Digital

Assets (2022) and the Accelerated Regulatory Incubation Programme (ARIP, 2024), prior to operational launch. Mansa Musa Integrated Solutions Nigeria Ltd has been established as the local entity to support regulatory engagement and future operations. The entity is not yet operational. Ubuntu Tribe will pursue the required approvals and licensing pathways as determined by the Commission before commencing operations in Nigeria.

Data Protection

Ubuntu Tribe processes personal data in accordance with the data protection laws applicable to each of its operating entities. This includes the EU General Data Protection Regulation (GDPR); the Mauritius Data Protection Act 2017; and the UAE Personal Data Protection Law (Federal Decree-Law 45/2021). Where personal data of individuals located in Nigeria is processed, we do so in alignment with the Nigeria Data Protection Act 2023; the lawful bases for processing are contract performance and legal obligation, with consent obtained for marketing communications. Registration with the Nigeria Data Protection Commission, and the appointment of a Nigeria specific Data Protection Officer, will be completed before Nigerian retail operations commence. Data subject rights of access, rectification, erasure, portability, and objection are implemented, and cross border transfer controls (including contractual safeguards) are applied where Nigerian personal data is processed outside Nigeria. As operations expand into additional jurisdictions, compliance extends to the applicable national data protection frameworks, for example POPIA (South Africa). A Data Protection Officer is designated and serves as the point of contact for supervisory authorities and data subjects across the Ubuntu Tribe group.

Investor Protection

Customer complaints are handled through a documented complaints procedure with defined response and resolution of SLAs. Unresolved disputes are escalated to the relevant ombudsman or arbitration forum in the customer's jurisdiction, subject to the governing law of the customer agreement.

Cooling off period. Retail users are entitled to a cooling off period of twenty-four hours from initial \$GIFT acquisition, during which tokens may be returned at the original acquisition price (minus applicable transaction fees), provided no portion of the acquired tokens has been transferred or redeemed and the user's KYC status remains valid.

Complaint handling. All complaints are formally acknowledged within five business days with an acknowledgement of the reference number. Target resolution is twenty business days from acknowledgement. Complex complaints requiring extended investigation (such as blockchain forensics or third-party vendor involvement) carry a maximum resolution time of forty business days, with the user notified of the revised timeline within the initial twenty business days. Unresolved complaints may be escalated to the relevant supervisory authority in the customer's jurisdiction. All complaints, investigations, and outcomes are logged and retained for a minimum of seven years.

Under EU MiCA, \$GIFT is engineered to satisfy the Asset-Referenced Token (ART) framework — fully reserved, redeemable, and built to meet the corresponding capital, reporting, and conduct requirements. Final classification under MiCA is subject to confirmation by the competent supervisory authority at the point of whitepaper notification; Ubuntu Tribe is engaged with Czech and EU advisers on the final characterization. The Czech VASP authorization enables Ubuntu Tribe to serve EU consumers and institutions across the EEA under harmonized rules, with full MiCA passporting available on confirmation of ART status.

Operational Flows

Token Lifecycle. Gold sourced from OECD aligned suppliers and allocated to a segregated vault account; independent auditor attestation; Proof of Reserves on chain update via the internal contract and the Chainlink oracle; multi signature mint authorization; tokens minted to the designated address; tokens distributed exclusively to KYC verified users.

Custody Flow. User self-custody of \$GIFT via Utribe Wallet (Web3Auth MPC 2 of 4) or external wallet (including MetaMask integration); physical gold custody at Sequoyah Vaults under allocated, bankruptcy remote bailment; Fireblocks MPC for institutional issuance and treasury operations; continuous Chainlink Proof of Reserves; quarterly independent physical audit by Harris & Trotter; user redemption (stablecoin, fiat, or physical) burns tokens and adjusts on chain reserve state.

Compliance Flow. User onboarding through Sumsub (identity verification, biometric, PEP and sanctions screening); tiered KYC (Tier 1 regulatory data collection only with no transactions permitted; Tier 2 the first transactional tier; Tier 3 enhanced due diligence for high value users); completion of Ubuntu Academy financial literacy onboarding where applicable; real time transaction monitoring through Elliptic; FATF Travel Rule data exchange at the one hundred United States dollar threshold; ongoing sanctions and adverse media screening; suspicious transaction reporting to the applicable Financial Intelligence Unit in each licensed jurisdiction; periodic compliance reporting to the relevant supervisory authority.

For **Nigerian users**, investor protection mechanisms will be aligned with applicable Nigerian regulatory requirements, including complaint handling, dispute resolution, and regulatory recourse as defined by the Securities and Exchange Commission Nigeria.

12 Risk Factors

Prospective users, partners, and counterparties should consider the following risk factors. The list is not exhaustive and does not replace independent legal, tax, and financial advice.

Market risk — Gold, silver, and other precious metal prices fluctuate. Token values track underlying spot prices and may decline. Past performance is not indicative of future returns.

Regulatory risk — The regulatory environment for tokenized real-world assets is evolving in every operating jurisdiction. Rule changes may require operational adjustments, additional licensing, or in extreme cases of

withdrawal from specific markets. Ubuntu Tribe maintains active legal and compliance posture but cannot guarantee continuity of access in any specific jurisdiction.

Technology risk — Smart contract bugs, oracle malfunction, key compromise, and infrastructure failure remain non-zero risks despite defense in depth controls. The platform mitigates audits, dual PoR, MPC custody, plausible contracts, and incident response playbooks but cannot eliminate residual risk.

Custody and counterparty risk — Physical reserves are held by third party vault operators under allocated arrangements and insured against the standard catalogue of risks. Counterparty default, insurance dispute, or geopolitical event affecting a specific vault remains possible. Distribution across multiple jurisdictions reduces concentration but does not eliminate it.

Operational risk — Payment of rail outages, exchange delistings, banking access changes, and key personnel turnover can affect platform availability and user experience.

Liquidity risk — Secondary market liquidity on listed exchanges is a function of trading volume and market maker activity. Periods of low liquidity may affect the spread between platform pricing and exchange pricing.

Forward looking statements — Statements regarding future products, roadmaps, jurisdictional expansion, partnerships, and financial outcomes are forward looking and inherently uncertain. Actual outcomes may differ materially.

13 Roadmap to 2030

Real world asset tokenization has moved from concept to deployed capital. Industry forecasts place the tokenized real world asset market on a trajectory toward approximately \$16 trillion by 2030 across asset classes. Ubuntu Tribe is positioned at the intersection of this growth — regulated, multi-metal, and infrastructure first.

The roadmap below summarizes the planned trajectory of the Ubuntu Tribe ecosystem. Dates are indicative and subject to regulatory, market, and execution conditions.

Phase	Window	Milestones
Phase 1 — Foundation	2024–2025	\$GIFT launch · BitMart and Coinstore listings · Czech VASP · audit infrastructure
Phase 2 — Expansion	2026	Ubuntu Academy Phase 1 (South Africa) · white label GA · additional jurisdictions
Phase 3 — Scale	2027–2028	PGMs and lithium backed instruments · pan African Academy rollout · institutional product expansion

Phase 4 — Maturity	2029–2030	Multi asset baskets · productized yield and structured products · twenty active jurisdictions
--------------------	-----------	---

Strategic targets to 2030

- Ten million active wallet users across consumer and institutional deployments.
- Twenty active regulated jurisdictions.
- Multi-billion dollar tokenized assets under custody across the asset suite.
- Ubuntu Academy at five-hundred thousand plus learners pan African.

14 Team & Governance

Ubuntu Tribe is led by a founding team combining capital markets experience, deep technology and blockchain expertise, regulatory engagement across multiple jurisdictions, and operating experience in African and emerging markets. The company is currently scaling its leadership and specialist teams to support regulatory expansion, institutional onboarding, and the next phase of platform growth.

Leadership

Mamadou Kwidjim Toure — Founder & Chief Executive Officer. Mamadou leads the group's strategic direction, regulatory engagement, and capital markets agenda. He drives the partnerships, jurisdictional expansion, and ecosystem development that underpin Ubuntu Tribe's mission of broad based access to tokenized real assets.

Lisa Loud — Chief of Staff and Chief Product Owner. Lisa runs the office of the CEO and owns the product organization, translating strategic direction into product roadmap, cross functional execution, and operating cadence across the group.

Oliver Lienhard — Chief Technology Officer. Oliver leads platform engineering and infrastructure across the Utribe Tokenization Platform (UTP), the \$GIFT issuance stack, and the wallet, custody, and compliance integrations. He is responsible for the engineering organization and the technical architecture of the platform.

Louis Sirico — Chief Information Officer, Chief Information Security Officer, and Data Protection Officer. Louis owns the group security and compliance posture, covering platform security architecture, audit posture, information security controls, and the group level compliance framework that overlays the regional compliance program.

Nosakhare Idehen — Head of Compliance, Africa. Nosa leads the AML/CFT program, KYC and KYB oversight, regulatory reporting, and regulatory liaison across Ubuntu Tribe's African operating jurisdictions, and serves as the designated Money Laundering Reporting Officer (MLRO) where applicable.

Robert Moka — Legal Head. Robert leads regulatory submissions, contract management, corporate governance, and the licensing workstreams across all Ubuntu Tribe jurisdictions.

Pascale Bartholomeeusen — Head of Business Development and Government Relations. Pascale leads institutional, government, and B2G partnerships across all Ubuntu Tribe markets, including sovereign partnership development, regulatory engagement strategy, and policy advocacy.

Dr. Muhammad Auwal Umar — Country Lead, Nigeria and Ghana. Auwal provides primary in country leadership for Nigerian and Ghanaian regulatory engagement, business development, and operations.

Faith Okafor-Mbah — Government Affairs Lead, Nigeria and Africa. Faith leads regulatory engagement, B2G regulatory strategy, and policy advocacy across the African market. She is co-founder of the Blockchain Nigeria User Group and a member of the Nigeria National Blockchain Policy Implementation Steering Committee.

The leadership team is expanding. Senior appointments across compliance, legal, finance, institutional sales, and regional operations are in progress as the platform scales. The current advisory roster includes senior practitioners across precious metals markets, digital asset regulation, capital markets, post quantum cryptography, and African business development; full leadership and advisory profiles are maintained on the corporate website and updated as the organization evolves.

Governance principles

- Separation of token holder governance from operational management.
- Multi signature controls on contract upgrades and reserve operations with mandatory time locks.
- Independent audit committee and external auditor reporting lines.
- Quarterly Proof of Reserve attestation and public transparency reporting.
- Community impact oversight by an independent committee with rotating membership.

Corporate structure

Entity	Role
Ophir Ubuntu International LLC (Mauritius)	Group holding
Ubuntu Uhuru s.r.o. (Czech Republic)	EU VASP operating entity
The Ubuntu Investment Company (United States)	Institutional product arm
Imperial Gold Holdings (United Kingdom)	UK institutional arm
Masa Musa Integrated Solutions Nigeria	Registered entity

15 Conclusion

Ubuntu Tribe was conceived from a simple proposition: precious assets — gold first, then silver and the metals that build the next economy : should be available to anyone with a smartphone, at any ticket size, with the same provenance and the same protections that institutions take for granted.

The technical, regulatory, and operational architecture set out in this whitepaper is the working answer to that proposition. The work is iterative. New jurisdictions will open, new products will launch, new partnerships will form. The infrastructure described here is engineered to extend — not to be rebuilt — as each new milestone arrives. That extensibility is itself a deliberate strategic choice: the moat is not any single product, but the shared stack underneath all of them.

“I am because we are.”

The Ubuntu philosophy is throughline. Every line of code, every contract, every fee allocation, every community growth mechanism in this document is engineered against that principle.

Ubuntu Tribe Precious assets for all — programmable, regulated, community built.

Appendix A — Supplementary Disclosures

The following items are maintained under separate confidential documentation and are available to regulators and qualifying counterparties upon request.

Disclosure	Status
Smart contract suite — Polygon Amoy test net deployment	Deployed. Mainnet addresses and external audit reports disclosed in formal offering documentation per issuance.
Reserve auditor	HT Digital / Harris & Trotter (IFRS compliant proof of reserves on published figures and on chain \$GIFT supply). Engagement letters on file; attestations available to regulators on request.
Reserve attestation reports (monthly Chainlink PoR + auditor attestations)	Attestations live on chain; full audit reports available to regulators upon request.
Money Laundering Reporting Officer	Designated under each licensed entity; details disclosed to relevant licensing authorities.
Vault operator agreements	Confidential between Ubuntu Tribe and counterparties; available to regulators upon request.
Vault insurance policies	Full coverage in place; certificates of insurance available to regulators upon request.

Smart contract audit reports	Independent third-party audits conducted prior to each mainnet release; reports available to regulators and qualifying institutional partners under NDA.
Cyber insurance and operational liability cover	In place; certificates available to regulators upon request.
Penetration test & security audit	ITnetworX GmbH (Switzerland), April 2026. Scores: 94/100 (security audit), 96/100 (penetration test). Zero exploitable findings. ISO/IEC 27001:2022 attestation — Annex A controls confirmed. Full reports available to regulators upon request.
Business Continuity Plan and Wind Down Plan	Maintained and tested annually (ref: UBTRIBE-BCP-2026-001); available to regulators upon request.

Disclosure	Status
Nigerian regulatory engagement	Ubuntu Tribe maintains active engagement with Nigerian regulatory counsel. Nigerian facing services are delivered through licensed partner Convexity in compliance with applicable SEC Nigeria frameworks.
Customer complaints policy	Published at utribе.one , gift.utribе.app , and docs.utribе.one .
Customer agreement and privacy policy	Published at product surfaces (utribе.one , gift.utribе.app , docs.utribе.one).

Appendix B — Substantiation Index

This appendix consolidates the supporting documentation referenced throughout this whitepaper. Each claim that previously read 'available on request' is mapped here to the specific instrument, issuing body, document type, and verification path. Where a document is not yet publicly disclosable, the relevant identifier and counterparty are listed so that prospective investors, regulators, and institutional partners can request a verification packet under NDA.

Smart contract audits. Counterparty / issuer: ITnetworX GmbH. Documentation: Independent audit reports (Solidity / EVM scope) with engagement letters and date stamped commit hashes.

Reserve attestations: Counterparty / issuer: Crowe — physical reserve attestation; HT Digital (Harris & Trotter LLP) — IFRS compliant proof of reserves attestation. Documentation: Crowe physical inventory attestation report; HT Digital proof of reserves attestation tying published reserve figures, prices, and on chain \$GIFT supply back to Crowe's physical inventory; both anchored on chain via Chainlink Proof of Reserve; available to regulators on request.

Vault custody. Counterparty / issuer: Sequoyah Vaults. Documentation: Bailment / custody agreement, segregated allocation schedule, and insurance certificate (Lloyd's / specie); inspection rights of the customer allocated holdings.

Vault insurance. Counterparty / issuer: Lloyd's London syndicates (specie cover). Documentation: Master policy schedule, indemnity limit, and per bar coverage matrix.

Bankruptcy of remoteness. Counterparty / issuer: Customer asset trust / SPV documentation. Documentation: Trust deed or equivalent ring-fencing instrument, supporting legal opinion on insolvency remoteness, and beneficial ownership mapping.

Chainlink Proof Reserve. Counterparty / issuer: Chainlink Labs feed contract. Documentation: Verifiable feed contract address, deviation thresholds, and node operator set; cross referenced against on chain mint authority.

Information security. Counterparty / issuer: ITnetworX GmbH, third party CREST testers. Documentation: ISO 27001 / SOC 2 attestation letters and penetration test executive summaries; full reports under NDA.

Regulatory standing. Counterparty / issuer: Per jurisdiction. Documentation: License numbers, sandbox admission letters, and supervisory correspondence (Kenya CMA sandbox, Nigeria SEC partnership model, EU MiCA whitepaper notification and ART classification pathway.).

Banking & payments. Counterparty / issuer: Operational banking partners. Documentation: Counterparty master agreements and segregated client money confirmations.

Mining provenance. Counterparty/issuer: supply chain provenance system. Documentation: Source of metal certifications, refiner chain of custody (aligned to global responsible sourcing standards), and field to vault tracking artefacts.

All listed materials are available for review by qualified counterparties under a mutual non-disclosure agreement. Where regulatory confidentiality applies (e.g. sandbox correspondence), Ubuntu Tribe will facilitate verification with the supervisory authority directly.
